The present invention relates to an electronic circuit card adapter, and more particularly to an electronic circuit card adapter for replacing an original electronic card with a new one. When a computer system is installed with a motherboard, some of the expansion cards installed into the computer system are taken out for replacement. As disclosed in Taiwan patent No. M330790 issued on Jun. 8, 2006 to C.H.T. SOHN, the replacement of expansion cards usually requires special tools such as an insertion forceps and an external forceps, which makes the replacement process complicated. In addition, if some of the cards are damaged, the whole computer system has to be shut down and then the damaged cards are replaced by new ones, which is inconvenient for users and results in a higher cost of replacement.

An oral glucose tolerance test in patients with suspected diabetes mellitus. The oral glucose tolerance test (OGTT) is used widely in the diagnosis of non-insulin dependent diabetes mellitus (NIDDM). The test involves ingestion of 50 g of glucose, and measurements of plasma glucose and insulin levels are made at specific time points over a period of 2 hours. Two disadvantages of the OGTT are the requirement for fasting and the need for venipuncture for collection of blood samples. To avoid these disadvantages, a modified test with a diet containing 5 g of glucose was developed. The advantages of the test are that the fasting time is reduced to less than 1 hour and that blood is not obtained by venipuncture. Plasma glucose levels were determined at 0, 30, 60, 120 and 180 minutes. A total of 77 patients with suspected diabetes mellitus were investigated. Diabetes mellitus was diagnosed in 33, impaired glucose tolerance in 20, normal glucose tolerance in three, and abnormal OGTT in 13 patients. The 82157476af
